

# Type B Anti-Slip Anti-Vibration Mounts

Anti-slip rubber mounts for light machinery, requiring no anchoring or mechanical fixing, providing stability and vibration isolation.

The Type B **AMC-MECANOCAUCHO® Anti-Slip range** is designed for applications requiring both **anti-slip performance and vibration isolation**, without permanent mechanical fixing.

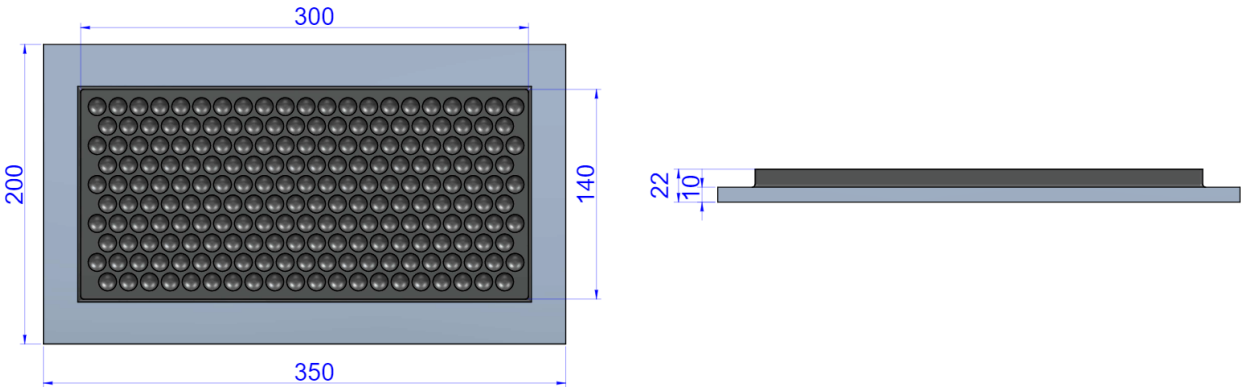

These mounts are manufactured from **high-grip rubber**, providing excellent contact with the supporting surface and helping to prevent machinery and equipment from moving due to vibration.

They are particularly suitable for installations where permanent fixing of the machine to the floor is not desirable, providing a **simple, quick and removable installation**.

The Anti-Slip range is particularly suitable for **light machinery and technical equipment** requiring good stability, protection against slipping and a **reduction in vibration transmission**.
