Cabin mounts

Anti-vibration mounts for the elastic suspension of mobile machinery cabins, designed to reduce vibration and structure-borne noise transmitted to the operator.

The **AMC-MECANOCAUCHO® Cabin Mounts** are specifically designed to provide **elastic suspension for cabins on mobile machinery** subjected to vibration, shock and dynamic loads.

Their design **decouples the cabin from the chassis**, reducing the transmission of **vibration and structure-borne noise** into the cabin. This isolation directly contributes to improving **operator comfort**, particularly during prolonged machine operation.

The **high-resilience elastomer**, bonded to the metal components, provides effective **vibration isolation**, with stiffness adapted to the loads and operating conditions of the cabin. The lower section incorporates an **elastomeric lip working in tension**, which limits excessive movement and provides **mechanical retention of the cabin**.

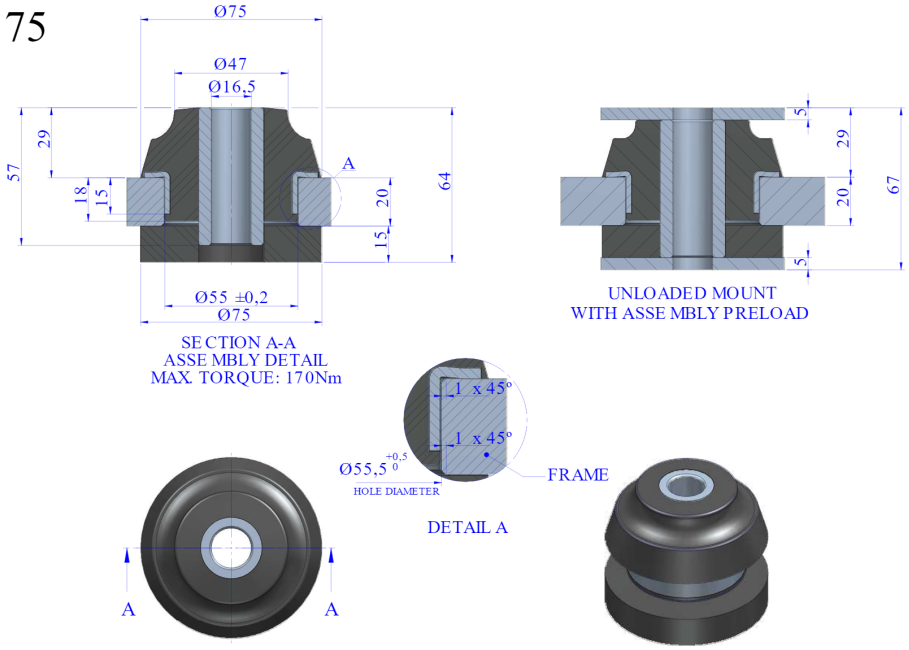

Thanks to their compact and robust design, these mounts provide an excellent balance between **vibration isolation, comfort, stability and safety**. They are particularly suitable for **tractors, construction machinery, off-road vehicles, agricultural machinery and other mobile equipment**.

Technical characteristics

This mount incorporates two annular shaped profiles in order to absorb dynamic loads or shocks. This feature is especially interesting for restricting the motion of the cabin under transient shocks.

Advantages

Easy Installation

This mount requires minimal structural modifications, making installation quick and straightforward.

High protection against weathering and chemical contamination

The bell housing protects the rubber from ozone and UV radiation, while also preventing contact with diesel, oils or other chemicals that could damage it.

Improved isolation

It offers improved isolation compared with conventional anti-vibration mounts of similar geometry.
