BF Vibration Isolators for Floating Floors

Cylindrical rubber vibration isolators for floating floors. Available in different diameters and heights to match isolation performance to project loads.

The BF vibration isolators are designed for floating floor systems requiring effective isolation of vibration and structure-borne noise.

Installed beneath the floating floor, they provide elastic decoupling from the supporting structure, reducing the transmission of vibration into the building.

They are manufactured from rubber with excellent mechanical and elastic properties and are available in different diameters and heights, allowing load capacity and isolation performance to be matched to the requirements of each project.

They can also be used for vibration isolation of machinery operating at speeds of 700 rpm and above, provided that the load and frequency characteristics of the installation are suitable.

Advantages

Easy installation

This mount requires no major modifications to the structure for installation.

Excellent value

This mount delivers very high performance for its cost compared to other possible solutions.
