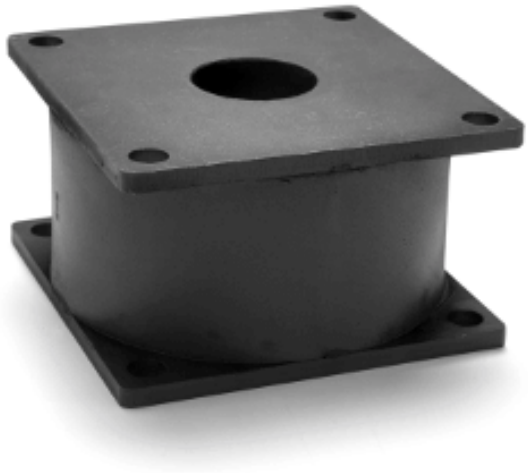
P-Type

Cylindrical support with central hole that improves elasticity. Ideal for isolation, mounting and guiding functions in light machinery.



The **Type P family from AMC MECANOCAUCHO®** consists of cylindrical anti-vibration supports with a **through central hole**, designed to operate under **vertical compression**, providing effective isolation against vibrations from light machinery.

The **presence of the central hole** not only allows for easy mounting using a screw or stud but also **increases the elasticity of the support**, enabling greater controlled deflection and better adaptation to variable loads. This configuration makes them suitable not only as support elements but also as **stops or guiding elements**, where axial displacement needs to be accompanied or limited.

These supports are made of **vulcanized rubber with optional metal base**, and are available in various sizes, hardnesses, and configurations according to load and application type.

Advantages

Easy installation

This mount requires no major modifications to the structure for installation.
