FZH2M + Sylomer® – Jack-Up Mounts for Floating Slabs

Jack-up mounts for high-performance floating slabs. Natural frequency from 2 Hz, with the slab raised after the concrete has cured.

The **FZH2M + Sylomer®** is a jack-up mount system designed for **floating slabs requiring very high levels of acoustic and vibration isolation**.

The mounts are integrated directly into the slab during casting. Once the concrete has cured, the system allows the **slab to be raised and isolated from the supporting structure**, preventing the formation of acoustic bridges.

Thanks to its design and the use of **Sylomer®**, the FZH2M can achieve **natural frequencies from 2 Hz**, providing particularly effective isolation of **vibration and structure-borne noise at very low frequencies**.

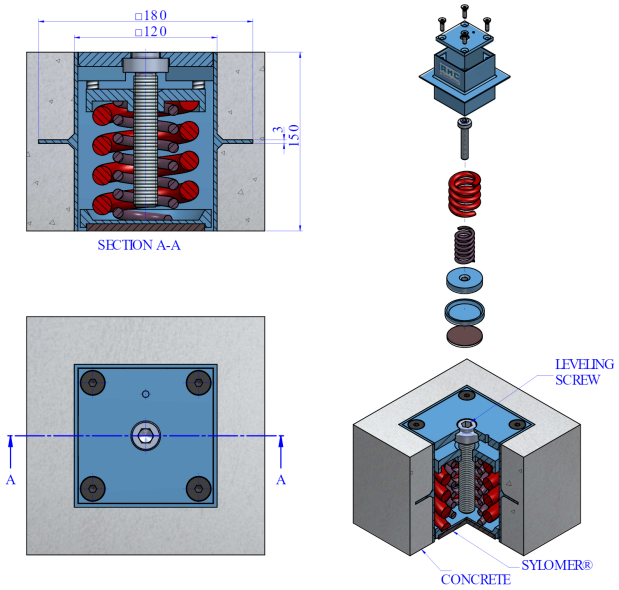

The system is particularly suitable for **studios, auditoriums, performance venues, mechanical rooms, and vibration-sensitive installations** where very high levels of acoustic isolation are required.

Advantages

Improved isolation

It offers improved isolation compared to conventional anti-vibration mounts of similar geometry.

Incorporates Sylomer® elastomer, highly effective for isolating both high and low frequencies

Sylomer® provides high isolation across a wide frequency range and is particularly effective at high frequencies, effectively eliminating the transmission of structure-borne noise.

Easy installation

This mount requires no major modifications to the structure for installation.
