EP 600 + Sylomer® Resilient Sway Brace

Resilient sway brace with Sylomer® for the acoustic decoupling of wall framing. Reduces acoustic bridges and the transmission of structure-borne sound.

The **EP 600 + Sylomer® Resilient Sway Brace** is designed for the **acoustic decoupling of wall assemblies and their metal framing**, creating a resilient connection between the framing and the supporting wall.

The **Sylomer® elements** provide resilient decoupling of the framing, effectively reducing the transmission of vibrations and **structure-borne sound**, while minimizing acoustic bridges at the attachment points.

Its design provides a **simple and robust connection for the metal framing** while maintaining the resilient decoupling required to achieve high acoustic performance. The elastic properties of Sylomer® also ensure stable and durable performance over time.

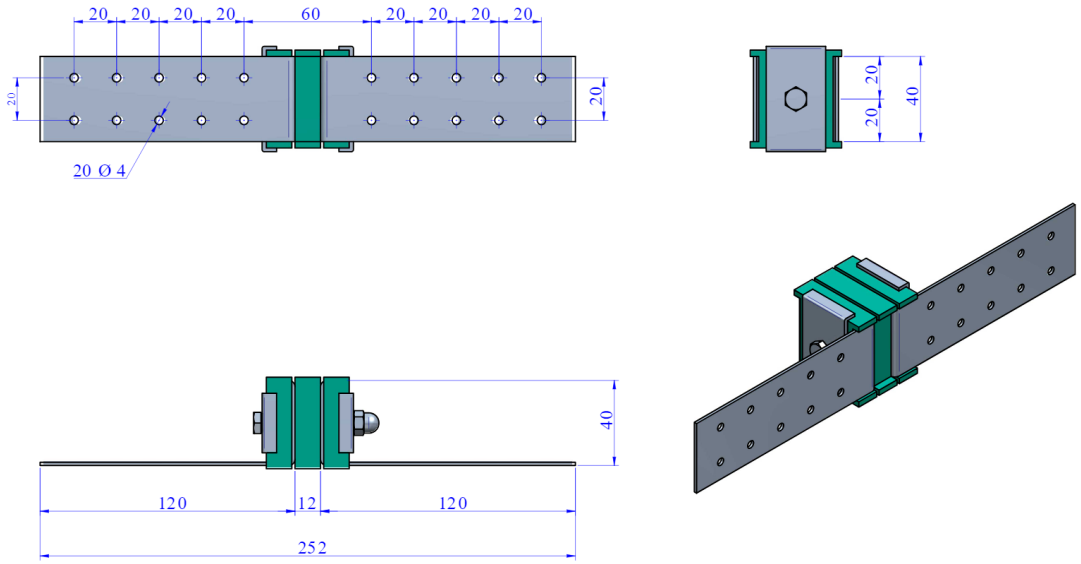

The EP 600 + Sylomer® is particularly suitable for **studios, residential buildings, auditoriums, mechanical rooms and soundproofing projects**, in both new construction and renovation applications.

Advantages

Easy installation

This mount requires no major modifications to the structure for installation.

Incorporates Sylomer® elastomer, highly effective for isolating both high and low frequencies

Sylomer® provides high isolation across a wide frequency range and is particularly effective at high frequencies, effectively eliminating the transmission of structure-borne noise.

Mount offering high stability

Suspensions built with this mount barely move, thanks to a geometry designed to control the movement of the suspended element.
